

HAMCLOCK ADVANCED

Flatpak Installation Guide · Fedora Linux · by W7CTY

Overview

This guide walks you through installing **HamClock Advanced** on Fedora Linux using the provided Flatpak package. HamClock Advanced is an amateur radio operations center featuring HF propagation conditions, DX cluster spots, NatGeo propagation map, world clocks, and QSO logging with QRZ Logbook upload.

Operating System	Fedora Linux 38, 39, 40, 41, 42, 43, or 44
Flatpak version	1.12 or higher (check: flatpak --version)
GNOME runtime	Platform 46 — installed automatically by the script
Internet access	Required during install (Flathub + map tiles at runtime)
Disk space	~300 MB (GNOME runtime + app)
sudo access	Required to install flatpak and flatpak-builder

1

Download the package

Download **hamclock-advanced-flatpak.tar.gz** from W7CTY and save it to your **Downloads** folder (~/.Downloads/).

*The filename contains an underscore before 'tar' when downloaded from Claude.ai:
hamclock-advanced-flatpak_tar.gz — both filenames work.*

2

Open a Terminal

Press **Super** (Windows key), search for **Terminal**, and open it. Or right-click the desktop and choose **Open Terminal**.

3

Extract the archive

Navigate to your Downloads folder and extract the package:

```
cd ~/.Downloads
```

```
tar -xzf hamclock-advanced-flatpak.tar.gz -C ~/.Downloads
```

If the filename has an underscore, use: tar -xzf hamclock-advanced-flatpak_tar.gz -C ~/.Downloads

4

Run the installer

Enter the extracted folder and run the install script:

```
cd ~/Downloads/hamclock-flatpak-fixed
```

```
chmod +x install.sh
```

```
./install.sh
```

The script will automatically:

- Install **flatpak** and **flatpak-builder** if not already present
- Add the **Flathub** repository
- Install the **GNOME Platform 46** runtime from Flathub
- Build HamClock Advanced from source
- Install the finished **.flatpak** bundle

You will be prompted for your sudo password once to install system packages.

5

Launch HamClock Advanced

Once installation completes, launch the app:

From the terminal:

```
flatpak run org.w7cty.HamClockAdvanced
```

From the desktop:

- Press the **Super** key (or click Activities)
- Type **HamClock** in the search box
- Click **HamClock Advanced**

First Run — Setup Wizard

When HamClock Advanced opens for the first time a setup wizard will appear:

- Enter your **callsign** (e.g. W7CTY)
- Enter your **Maidenhead grid square** (e.g. FN31 or FN31pr) — the map will centre on your location automatically
- Not sure of your grid square? A link to QRZ Grid Mapper is provided in the wizard
- Click **START HAMCLOCK ADVANCED**

Your callsign, grid square, and theme preference are saved and restored automatically on every subsequent launch.

Settings (Gear Menu)

Click the  **gear icon** in the top-right corner of the banner to open settings:

Dark Mode	Toggle between light and dark themes (saved automatically)
Font Size	Six sizes: A / A+ / A++ / A+++ / A+4 / A+5 (100% to 200%)
Expand Map	Expand the propagation map to full height
QRZ Login & API Key	Enter your QRZ Logbook API key to enable QSO upload
My Station Settings	Re-open the callsign and grid square wizard
Instructions	Full in-app help and feature guide
Share This App	Copy a shareable link with your callsign and grid

Keyboard Shortcuts

F5	Reload the dashboard
F11	Toggle fullscreen mode
Esc	Exit fullscreen
Ctrl +	Zoom in
Ctrl –	Zoom out
Ctrl 0	Reset zoom to 100%
Ctrl R	Reload
Ctrl Q	Quit HamClock Advanced

Uninstalling HamClock Advanced

To remove the app:

```
flatpak uninstall --user org.w7cty.HamClockAdvanced
```

To also remove the GNOME runtime (only if no other Flatpak apps use it):

```
flatpak uninstall --user org.gnome.Platform//46
```

Troubleshooting

flatpak-builder: command not found

flatpak-builder is a separate Fedora package. Run:

```
sudo dnf install -y flatpak-builder
```

```
then re-run ./install.sh
```

Cannot mkdir: Permission denied (tar error)

You ran tar from a directory you don't own. Always cd to Downloads first:

```
cd ~/Downloads
```

```
tar -xzf hamclock-advanced-flatpak.tar.gz -C ~/Downloads
```

This version is already installed (flatpak error)

The app is already installed. Uninstall first, then re-run:

```
flatpak uninstall --user org.w7cty.HamClockAdvanced
```

```
./install.sh
```

No appstream data warning during build

This is a harmless warning — the build succeeds regardless. You can ignore it.

GNOME Platform 48 end-of-life warning

This package uses GNOME Platform 46 which is fully supported. If you see a Platform 48 warning it means a previous install used 48. Uninstall and reinstall using this package.

Map tiles not loading

HamClock Advanced requires internet access to load NatGeo map tiles. Check your network connection. Core features work offline.
